

Best practices to unlock more revenue with **AdMob Mediation**

This checklist serves as a self-service guide to help you maximize revenue and enhance user experience. Let's level up your AdMob Mediation!

- Unlock ad revenue
- Increase user LTV
- Boost engagement

The following recommendations can help you get the most out of [AdMob Mediation!](#)

1. Maximize your bidding strategy

- ❑ **Expand bidding:** Enable bidding for all supported ad networks in your mediation stack. Bidding can increase competition and drive higher ad revenue. Access a diverse demand of [bidding ad sources](#) including options that are easy to integrate and require no SDK implementation.
- ❑ **Monitor performance:** Closely track the performance of your bidding networks with [AdMob reports](#). Analyze metrics like win rate, eCPM, and overall revenue contribution (see Tip 5 for details).
- ❑ **Create [mediation groups](#):** Utilize mediation groups to manage ad sources.
- ❑ **Adjust strategies:**
 - ❑ Consider network conditions and bidder performance. View the [Bidding FAQ](#) for additional guidance.
- ❑ **Consider regional variations:** Network performance can vary significantly by user region. Tailor your bidding strategy to optimize for local market conditions by leveraging mediation group country targeting and following [guidance on internationalization](#).

2. Optimize ad formats and targeting

- ❑ **Enable [high engagement ads](#):** This activates high-performing ads for **rewarded and interstitial ads** to boost user engagement and improve overall ad performance.
- ❑ **Consider innovative ad formats:** Exploring diverse ad formats beyond traditional banners like [collapsible banners](#), [app open ads](#). You can also consider [native ads](#) if you're looking to create custom ad experiences of any size.

3. Set up ad units effectively

- ❑ **Use [Firebase Remote Config](#) to set up ad units:** Run A/B tests, customize your app for different user segments and roll out changes easily without requiring you to download an app update. Refer to the [tutorial](#) to get started.
- ❑ **Define and implement a naming convention for each ad unit:** Defining unique ad unit codes for each placement enables granular control, optimizes performance and facilitates effective A/B testing, and provides detailed reporting, leading to improved ad revenue and user experience.
- ❑ **Test your mediation setup in real-time:** Leverage [Ad inspector](#) to ensure a seamless ad experience by troubleshooting third-party ad sources and SDK bidders.

4. Conduct Mediation A/B testing

[Regularly A/B test different mediation settings](#) to identify the optimal configuration for your app. This can involve testing different waterfall orders, eCPM floors, bidding strategies, and ad unit settings:

- ❑ **Strategic traffic allocation:** Carefully consider the % of users allocated to the test. Start with a smaller percentage (e.g., 10-20%) to minimize potential revenue impact if a variant performs poorly, and scale up as confidence grows.
- ❑ **Focused testing objective:** Clearly define the key metric(s) you want to improve (e.g., eCPM, revenue, match rate). A well-defined objective will guide your test design and analysis.
- ❑ **Leverage variant reusability:** Utilize the *Variant Selector* to reuse previous variants to streamline testing. This can save time and effort when comparing new variations against established benchmarks.
- ❑ **Holistic performance evaluation:** Utilize the *Summary Metrics Page* to also consider the impact on other key metrics. E.g. a variant might increase eCPM but decrease match rate. Use the comparison charts to get a holistic view of performance across revenue, eCPM, and match rate by ad source.
- ❑ **Refinement:** Remove underperforming networks and introduce new ones for testing.
- ❑ **Evaluation:** Continuously evaluate your ad networks and make changes as needed to maximize your ad revenue.

5. Leverage AdMob reports for deep insights

- ❑ Familiarize yourself with the following [AdMob reports](#):
 - ❑ [Ads activity report](#): Shows how your ad units are performing, including impressions, clicks, and revenue, helping you optimize ad placement and formats.
 - ❑ [Cohort report](#): Tracks the performance of a group of users who started using your app around the same date, revealing long-term engagement and monetization trends.
 - ❑ [User Activity report](#): Provides insights into how users interact with your app, such as session duration and screen views, which can inform ad placement and targeting.
 - ❑ [eCPM Trends](#): Displays how your average eCPM (effective cost per mille) changes over time, allowing you to identify factors impacting ad revenue and adjust your strategy accordingly.
- ❑ Use [customized reports](#) to dive deeper into specific metrics and identify areas for improvement.

6. Leverage Firebase for advanced targeting:

- ❑ **Test for emerging markets:** Leverage [Firebase A/B testing](#) and/or your [user activity report](#) to evaluate ads performance in emerging markets where phone usage are higher. Target specific markets, test, and analyze results before broader implementation.
- ❑ **Show ads to predicted on-purchases:** Maximize user lifetime value by showing ads to predicted non-payers earlier (see example below)

7. Optimize ad experience

- ❑ **Implement [frequency capping](#)** to enhance user experience and maximize ad revenue. Utilize [Firebase Remote Config](#) to test and refine ad frequency setting, ensuring a balance between monetization and user satisfaction.
- ❑ **Optimize [banner refresh rate](#)** to boost impressions and revenue per user.
- ❑ **Improve [show rates](#)** to increase your proportion of paid ad impressions and revenue. Here are some tips to do so:
 - ↺ ↻ ❑ **Prefetch ads** to reduce loading time. If there is no cached ad to show, fetch an ad and store it in cache first.
 - 🕒 ❑ **Avoid expired ads** as you are only paid for valid impressions. Any ad object held without display for longer than 4 hours for app open ads and longer than 1 hour for rewarded, interstitial and banner ads should be discarded and replaced with new ads from a new request.
 - ❑ **Ensure that your app has more content than ads in multiple screens.** This [violation](#) is not triggered by any one specific ad format but assesses the ad placement strategy in multiple consecutive screens. All ad types are considered, not just Google-served ads.

8. Stay up-to-date

- ❑ **Keep your SDKs updated:** Ensure you are using the latest versions of the AdMob SDK ([Android](#), [iOS](#), [Unity](#)) and the SDKs of your integrated ad networks. This will ensure you have access to the latest features and bug fixes.
- ❑ **Avoid policy violations:** Stay informed about the [latest AdMob policies](#) and abide by them to create great experiences for your users. Here are some [common policy violations](#) to take note of.

9. (if applicable) Optimize your [waterfall strategy](#)

- ❑ **Start with a tiered approach and adjust accordingly:** When setting up your AdMob [mediation stack](#), consider starting with a tiered approach, such as three calls per network (High, Mid, Low floors). Analyze each call's revenue contribution; if low, incrementally reduce the floor price, and if high, consider adding a call with a higher floor. Continuously monitor and adjust based on performance data to optimize your waterfall.
- ❑ **Apply Ad Network Optimization (ANO):** [ANO](#) automatically reorders your waterfall to ensure that the highest-paying ad networks are always at the top.
